

# BDF - MODULE 4

Multichain Blockchain

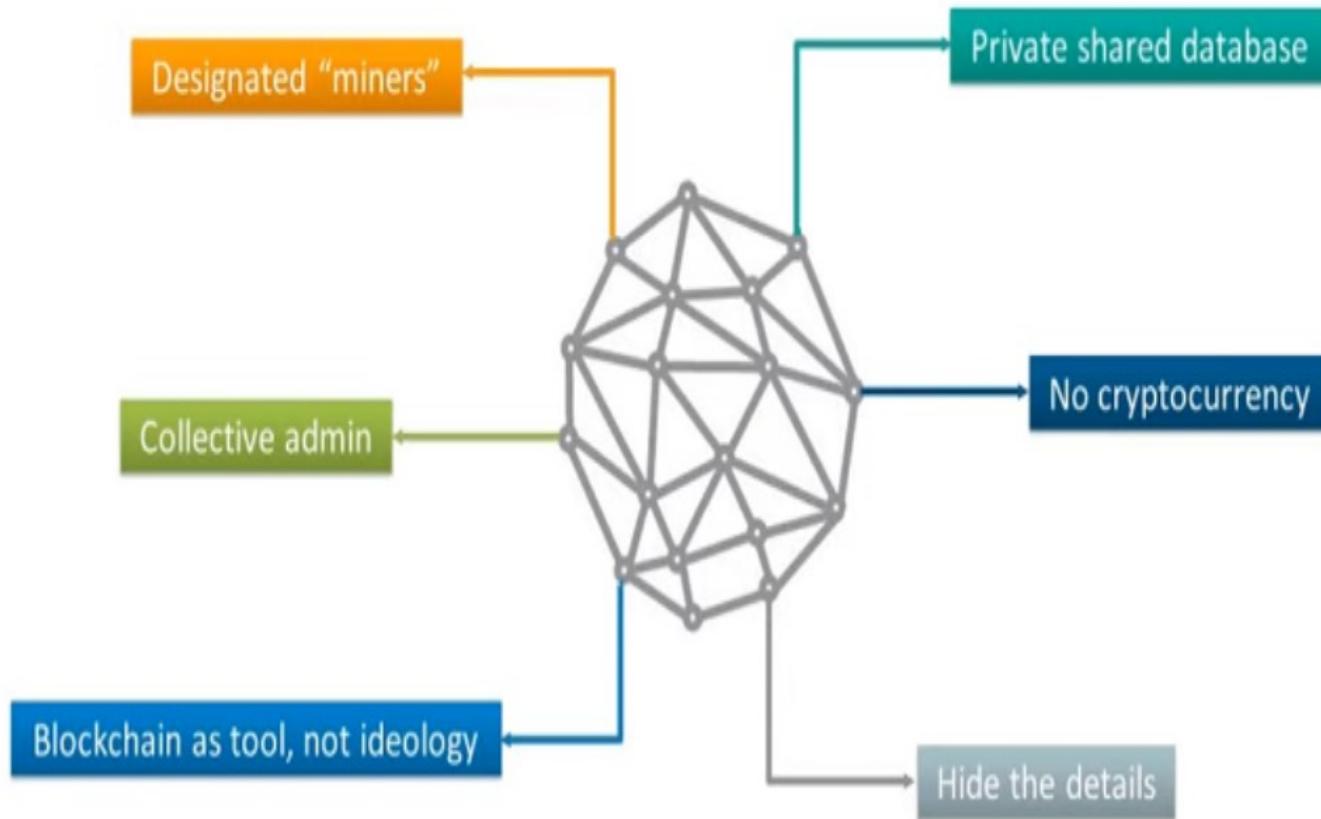

# What Is MultiChain?

# About Multichain Blockchain

- Lightweight
- Bitcoin fork (soft fork - started in 2014)
- No Smart contract (limitation)
- No native/default currency/tokens (customize)
- No PoW
- Concept of Assets, Streams, Mining
- No support for Docker container/emulator (limitation)

# Blockchains For Enterprise

Following parameters should be kept in mind while implementing Blockchain in Enterprise domain:

# Introducing MultiChain

---

01

MultiChain is an off-the-shelf platform for the creation and deployment of private Blockchains, either within or between organizations

02

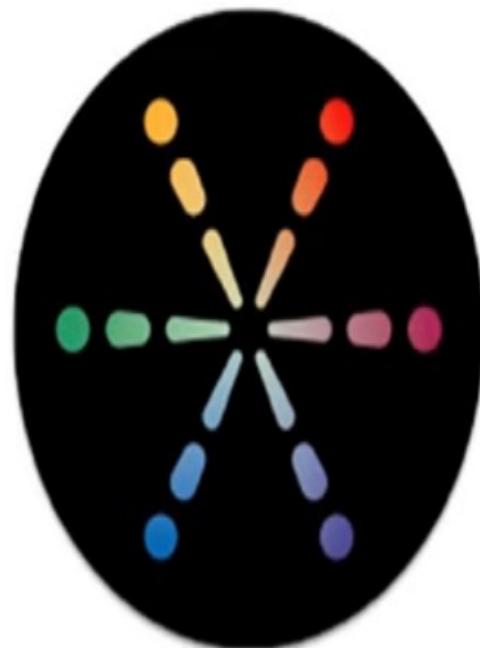

Derived from Bitcoin core software, hence it is compatible with Bitcoin ecosystem

03

MultiChain supports Windows, Linux and Mac servers

04

Provides a simple API and command line interface that makes it easy to maintain & deploy

# MultiChain Helping Enterprise In Blockchain

## Managed permissions

Dynamically control who can connect, send and receive transactions, create assets, streams and blocks.  
Each Blockchain is as open or as closed as you need

## Rapid deployment

Just two simple steps to create a new Blockchain, and three to connect to an existing one. Deploy unlimited Blockchains per server for cross-chain applications

## Unlimited assets

Issue millions of assets on a Blockchain, all tracked and verified at the network level.  
Perform safe multi-asset and multi-party atomic exchange transactions

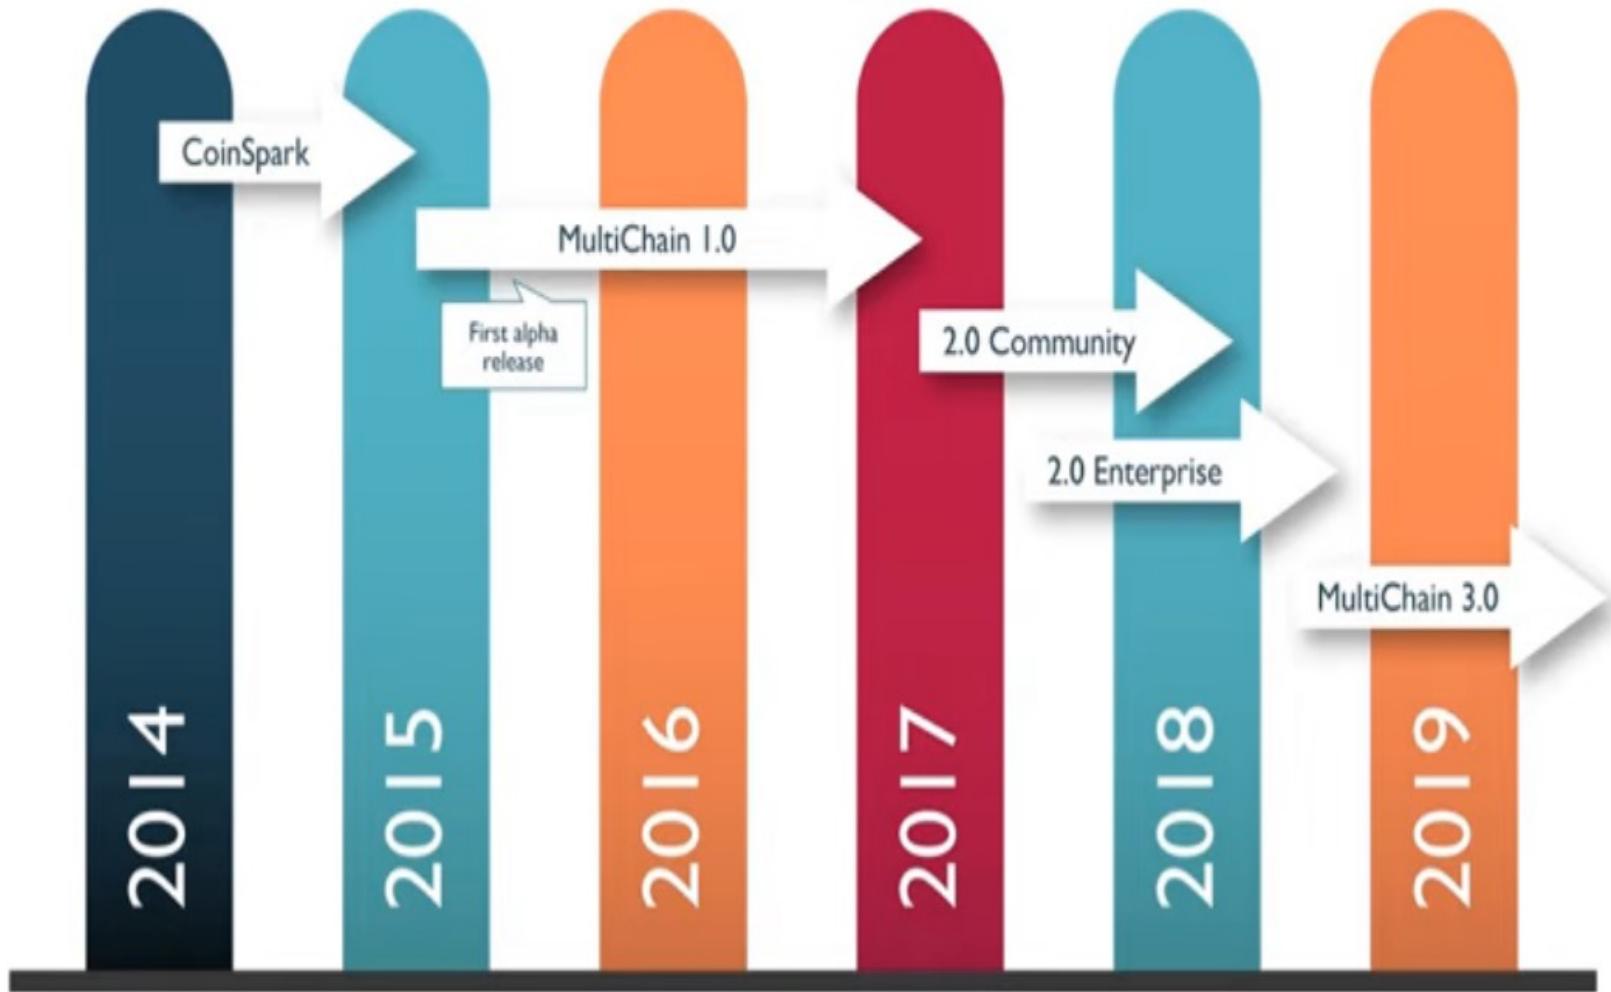

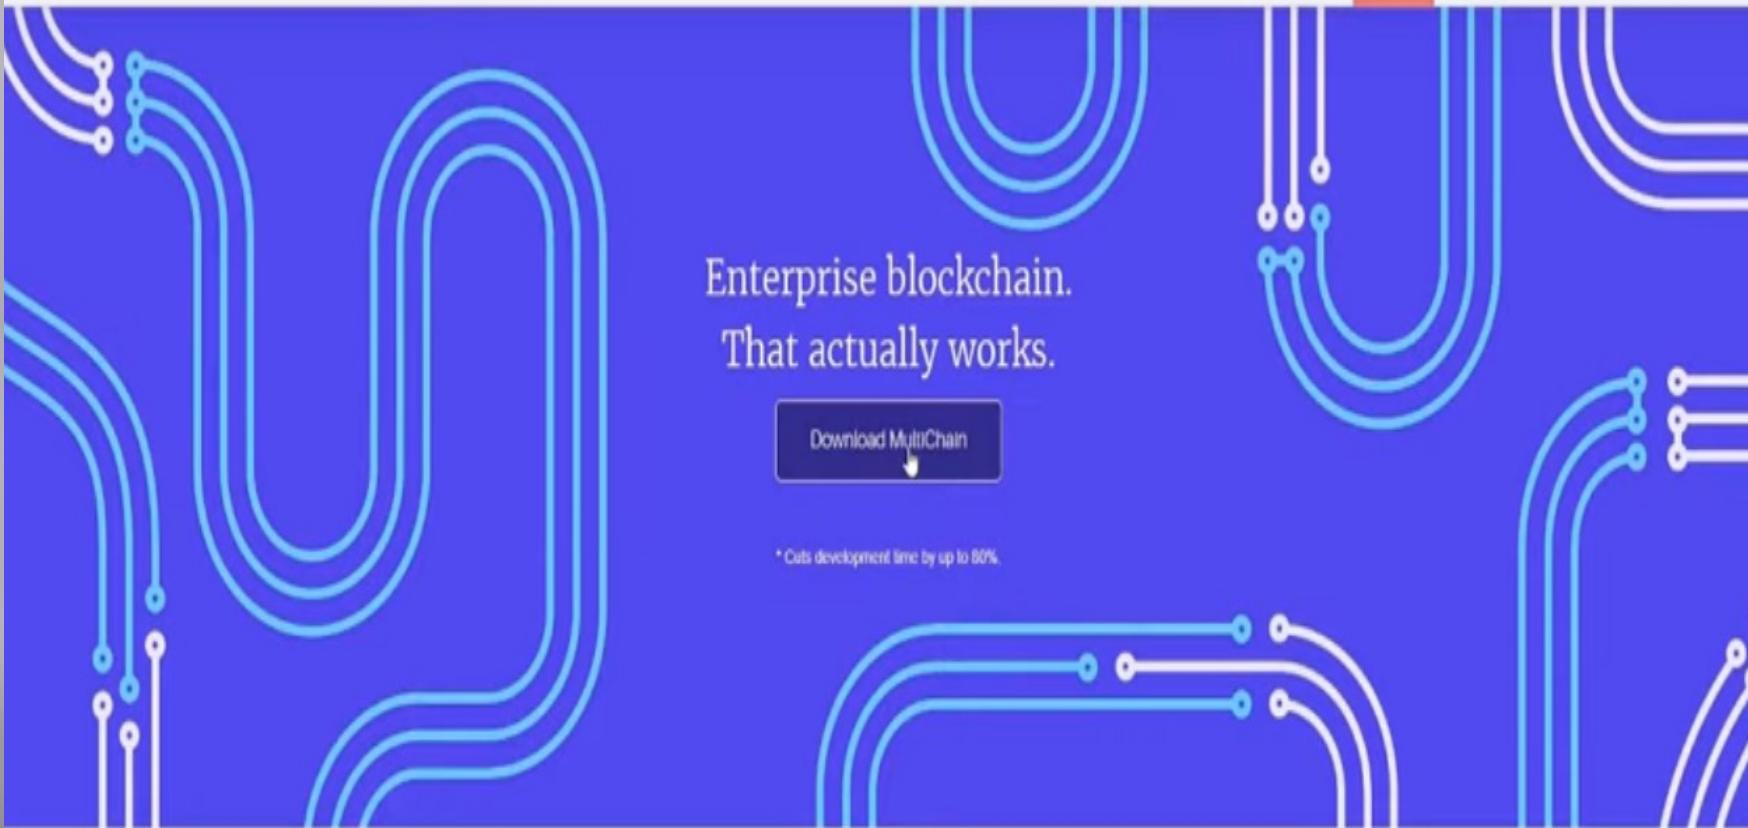

## Data streams

Create multiple key-value, time series or identity databases on a Blockchain. Ideal for data sharing, timestamping and encrypted archiving

# MultiChain – Development Timeline

Enterprise blockchain.  
That actually works.

# Bitcoin To Private Blockchain

Many aspects of MultiChain's design are aimed at enabling smooth transitions between private Blockchains and the bitcoin Blockchain in either direction.

Based on a fork of Bitcoin Core. Code changes are localized, enabling future bitcoin enhancements to be merged in

Its multicurrency and messaging features work very similarly to the CoinSpark protocol for enhancing bitcoin transactions

It can act as a node on the regular bitcoin network via a simple protocol setting in the per Blockchain configuration file

It uses bitcoin's protocol, transaction and Blockchain architecture, with changes only to the handshaking process

Its interface is fully compatible with that of Bitcoin Core, with all additional functionality provided by new commands

# Aim Of MultiChain

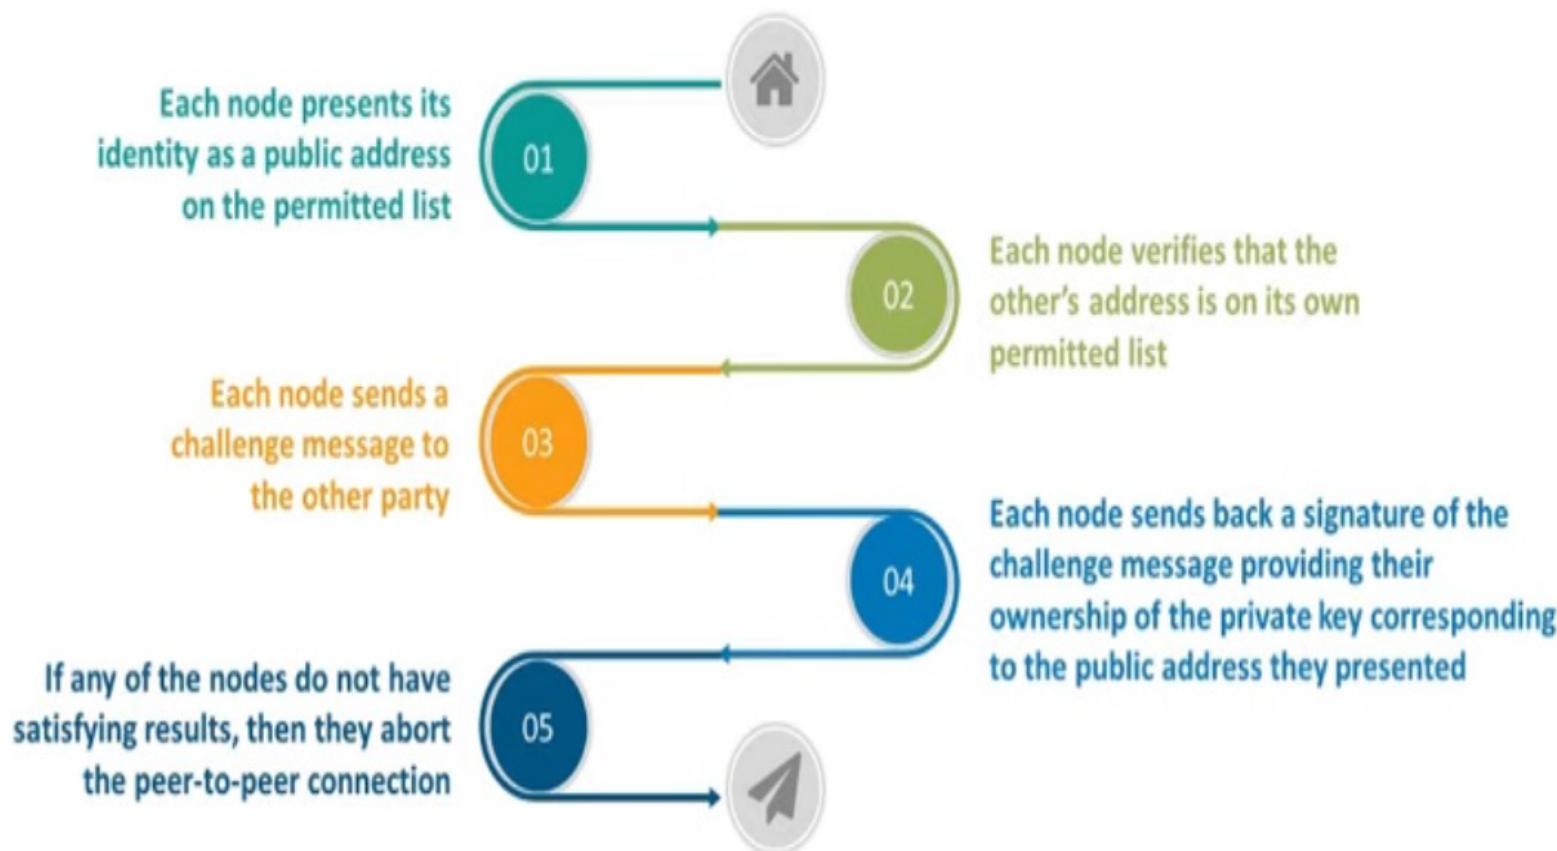

---

The main aim of MultiChain is:

- 1 To ensure that visibility of Blockchain's activity must be chosen through the chosen participants
- 2 To control over which transaction are permitted
- 3 To enable more secure mining with Proof-of-Work and its associated cost
- 4 The Blockchain system only stores transactions related to participants

# The Hand-Shaking Process

MultiChain uses private key cryptography property to restrict Blockchain access to a list of permitted users, by expanding the “handshaking” process that occurs when two Blockchain nodes connect.

# Use-Cases Of MultiChain

# MultiChain Permissions

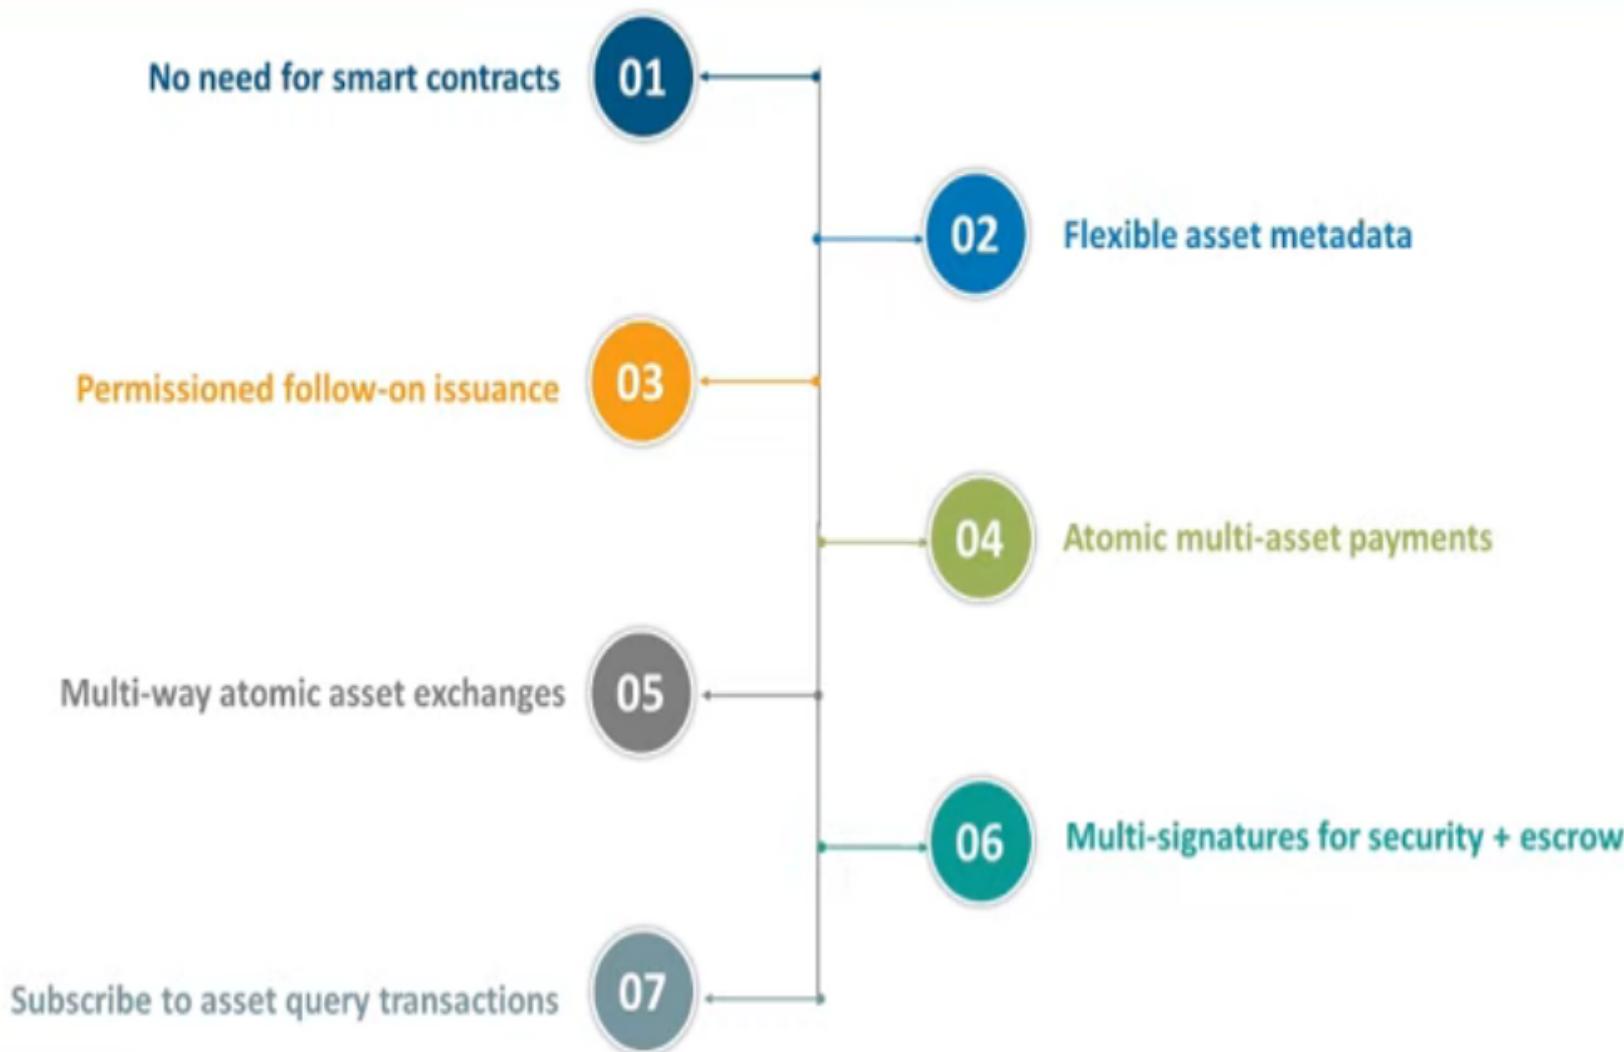

---

MultiChain provides following permissions:

- Connect to network
- Send and receive transactions
- Write to a stream
- Issue assets
- Create streams
- Add blocks to chain
- Change permissions by consensus

# MultiChain Assets

# MultiChain Streams

Provide a natural abstraction for Blockchain use cases which focus on general data retrieval, timestamping and archiving

Any number of streams can be created & each stream acts as an independent append-only collection of items

Nodes choose which streams to index

Streams can be used to implement three different types of databases on a chain:

A key-value database or document store, in the style of NoSQL

A time series database, which focuses on the ordering of entries

An identity-driven database where entries are classified according to their author

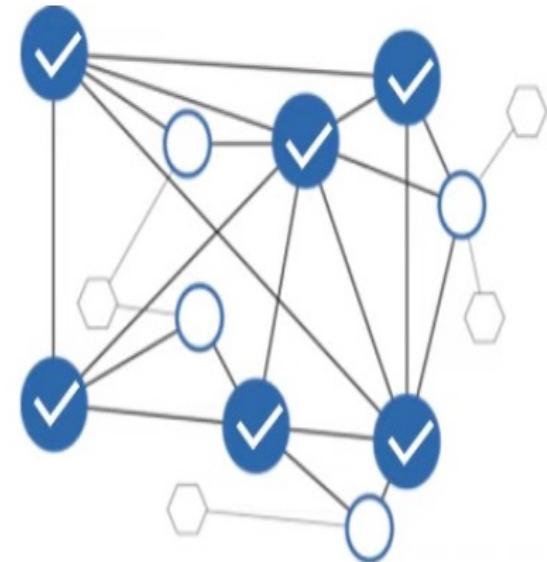

# Consensus Model

Distributed consensus between identified block validators. There is one validator per block, working in a round-robin type of fashion

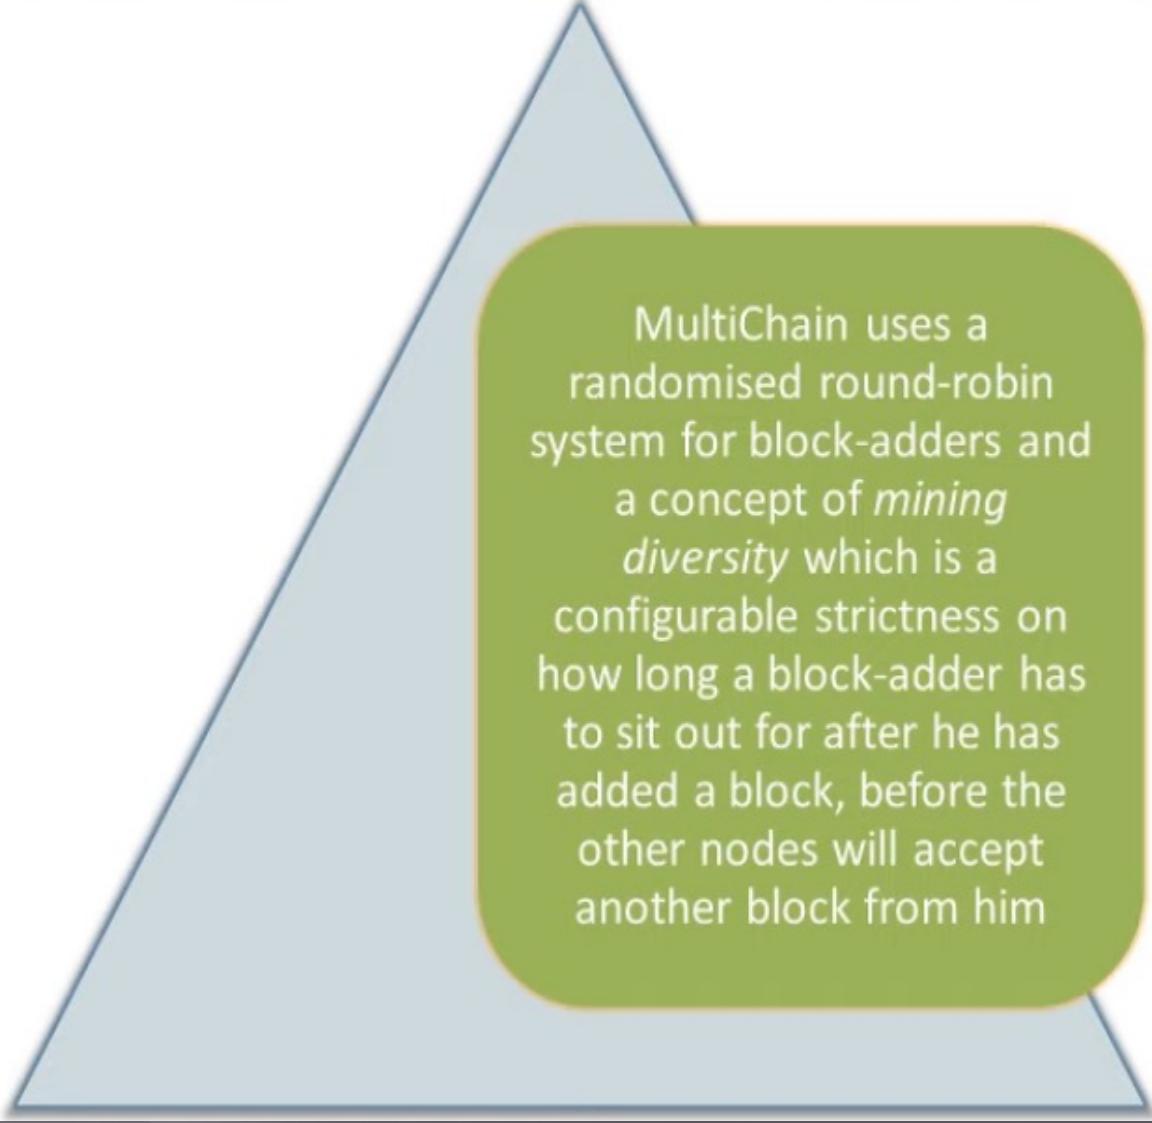

Every block digitally signed by creator. Only permissioned parties can “mine”

Mining diversity for distributed consensus

No proof-of-work or cryptocurrency

# Mining In MultiChain Technology

MultiChain uses a randomised round-robin system for block-adders and a concept of *mining diversity* which is a configurable strictness on how long a block-adder has to sit out for after he has added a block, before the other nodes will accept another block from him

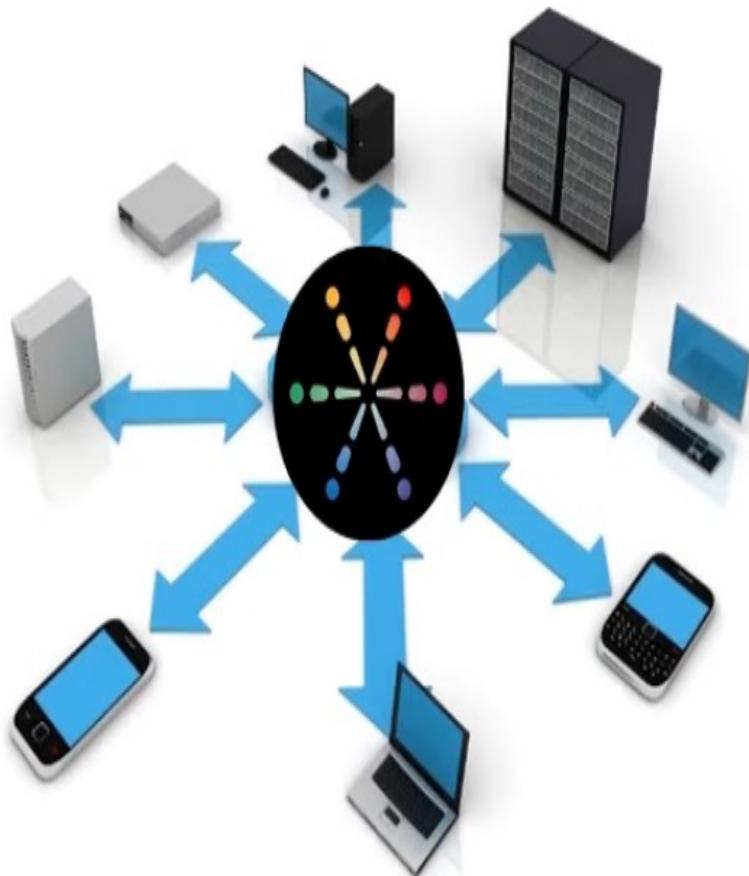

# MultiChain Flexibility

---

- 01 45+ Blockchain parameters. Block size/time, permissioning, admin consensus, mining, optional native currency
- 02 Permissions can change over time
- 03 Assets: reissuance and destruction
- 04 Streams: nodes follow their interests
- 05 Custom metadata everywhere
- 06 Unified JSON-RPC API for applications

# Deployment Options

- Environment agnostic
  - Self-hosted in datacenter
  - Public or private cloud
  - Accessed as a service
- Nodes added simply and quickly
- API cleanly separates app from node
- Shared administration model
  - Smooth governance transitions

# Security In MultiChain

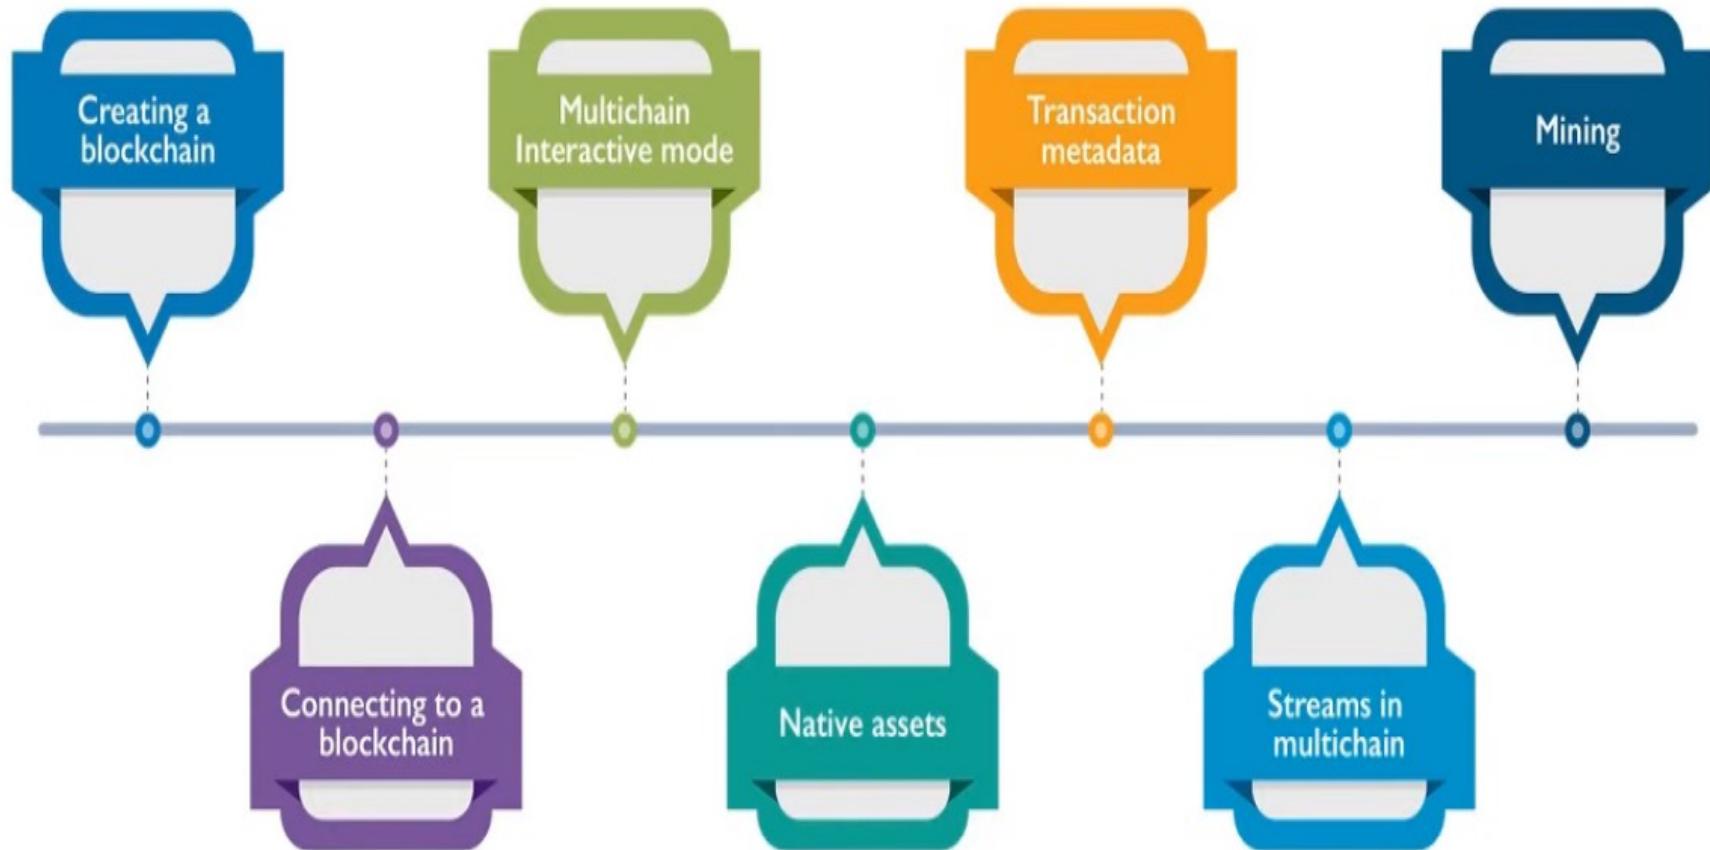

---

- Forked from Bitcoin Core
  - \$40B+ and over 8 years exposure to internet
- Full multi-signature support
- External key management
  - Bitcoin hardware security modules
- Consensus over data not execution
  - Avoids Ethereum-style hard forks
  - No need for fees to stop runaway

# Steps To Create And Deploy Private Blockchain

Following are the steps to create & deploy private Blockchain:

This tutorial requires two server nodes. If you have not done so already, please download and install MultiChain Community or Enterprise Demo on each server. Note that one section of this guide applies to MultiChain Enterprise only.

## 1. Creating a blockchain

First we will create a new blockchain named `chain1`. On the first server, run this command:

```
multichain-util create chain1
```

If you are using Windows, first open a DOS command line in the directory where you installed the MultiChain executables. You can do this by navigating to that directory in the Windows Explorer, then typing `cmd` in the address bar at the top.

There are many blockchain parameters that can be modified, but we'll leave them on their default settings. Now initialize the blockchain, including creating the genesis block.

```
multicheind chain1 -daemon
```

You should be told that the server has started and then after a few seconds, that the genesis block was found. You should also be given the node address that others can use to connect to this chain.

Copy and paste the node address here: **chain1@[ip-address]:[port]**

## 2. Connecting to a blockchain

Now we'll connect to this blockchain from elsewhere. On the *second* server, run the following:

```
multicheind chain1@[ip-address]:[port]
```

You should be told that the blockchain was successfully initialized, but you do not have permission to connect. You should also be shown a message containing an address in this node's wallet.

Copy and paste the wallet address here: **1...**

Back on the *first* server, add connection permissions for this address:

```
multichain-cli chain1 grant 1... connect
```

Now try reconnecting again from the second server:

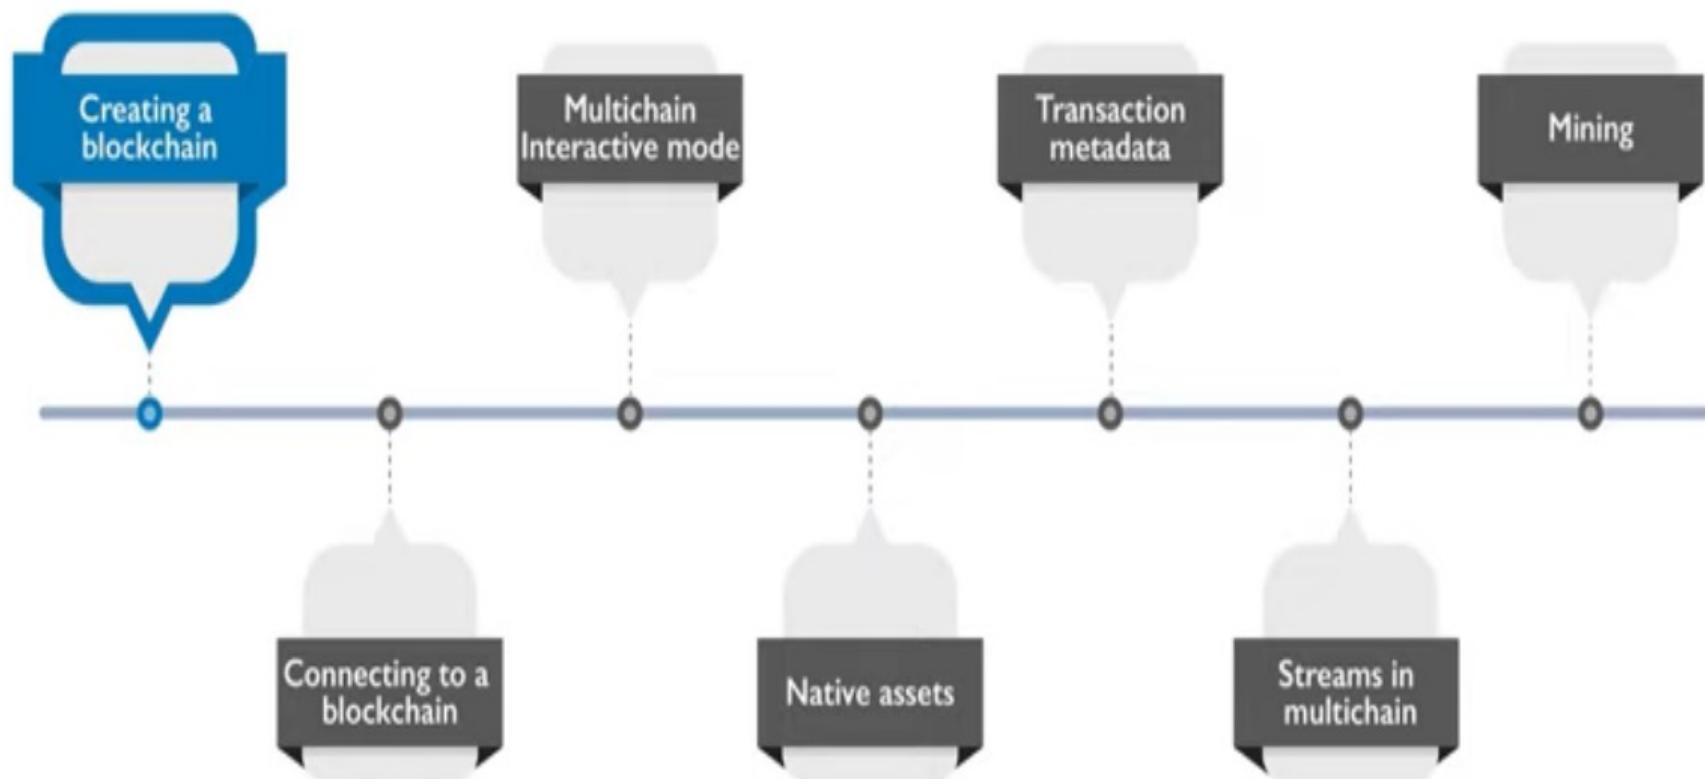

```
multicheind chain1 -daemon
```

You should be shown a message that the node was started, and it should display this second node's address.

## 3. Some commands in interactive mode

Before we proceed, let's enter interactive mode so we can issue commands without typing `multichain-cli chain1` every time. On *both* servers:

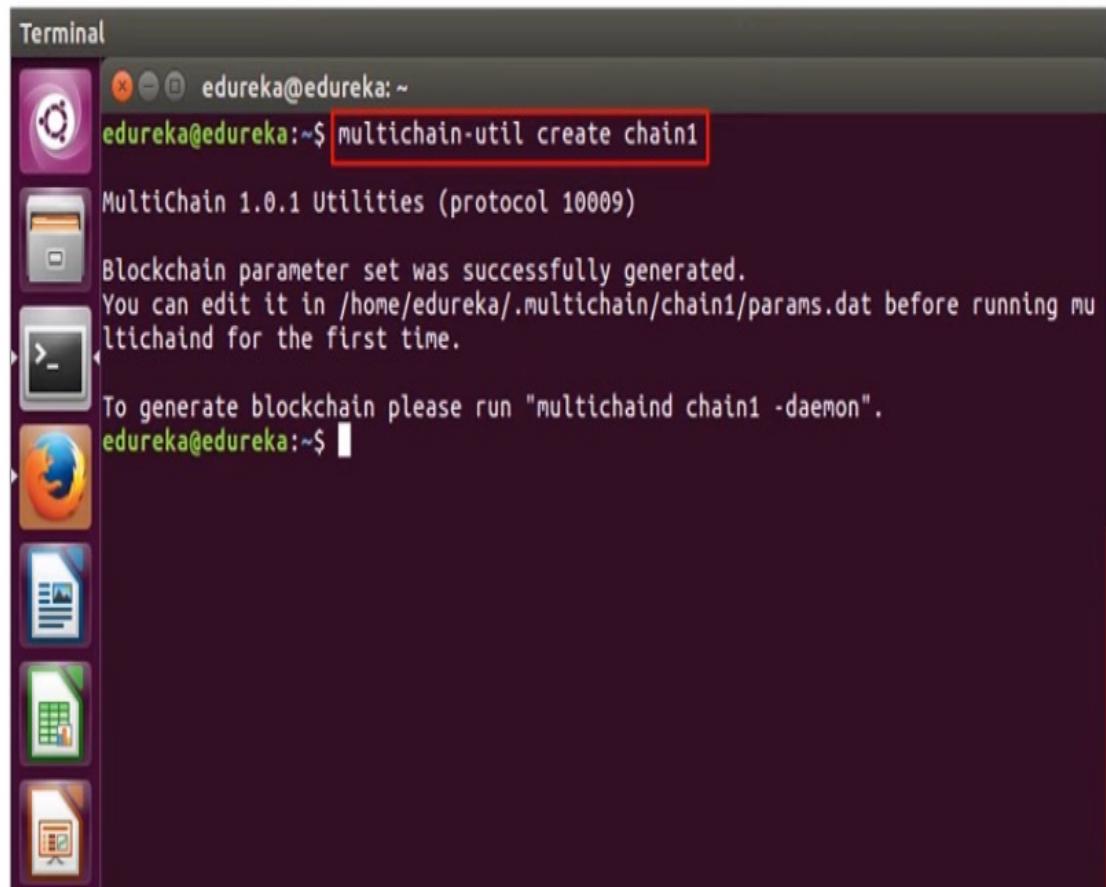

# Step 1: Creating A Blockchain

# To Create A Blockchain

---

- First we will create a new Blockchain named **chain1** (you can give the name of your choice).
- On the first server, run this command: **MultiChain-util create chain1**

A screenshot of an Ubuntu desktop environment. In the center is a terminal window titled "Terminal". The terminal shows the command "multichain-util create chain1" being run by the user "edureka@edureka:~". The output of the command indicates that the "Blockchain parameter set was successfully generated" and provides instructions to edit the file "/home/edureka/.multichain/chain1/params.dat" before running "multichainind".

```
Terminal
edureka@edureka:~$ multichain-util create chain1
MultiChain 1.0.1 Utilities (protocol 10009)
Blockchain parameter set was successfully generated.
You can edit it in /home/edureka/.multichain/chain1/params.dat before running mu
ltichainind for the first time.
To generate blockchain please run "multichainind chain1 -daemon".
edureka@edureka:~$
```

# View Default Settings

- To view the Blockchain's default settings run the following commands:

```
cat ~/.MultiChain/chain1/params.dat
```

(Above command will list the parameters and settings of the Blockchain)

Note: List shown here is just a specimen.  
As the list was too long to display on the ppt

```
edureka@edureka:~  
edureka@edureka:~$ cat ~/.multichain/chain1/params.dat  
# ---- Multichain configuration file ----  
  
# Created by multichain-util  
# Protocol version: 10009  
  
# This parameter set is VALID.  
# To join network please run "multichaind chain1".  
  
# The following parameters can only be edited if this file is a prototype of another configuration file.  
# Please run "multichain-util clone chain1 <new-network-name>" to generate new network.  
  
# Basic chain parameters  
  
chain-protocol = multichain # Chain protocol: multichain (permissions, native assets) or bitcoin  
chain-description = MultiChain chain1 # Chain description, embedded in genesis block coinbase, max 256 chars.  
root-stream-name = root # Root stream name, blank means no root stream.  
root-stream-open = true # Allow anyone to publish in root stream  
chain-is-testnet = false # Content of the 'testnet' field of API responses, for compatibility.  
target-block-time = 15 # Target time between blocks (transaction confirmation delay), seconds. (2 - 86400)  
maximum-block-size = 8388608 # Maximum block size in bytes. (1000 - 1000000000)  
  
# Global permissions  
  
anyone-can-connect = false # Anyone can connect, i.e. a publicly readable blockchain.  
anyone-can-send = false # Anyone can send, i.e. transaction signing not restricted by address.  
anyone-can-receive = false # Anyone can receive, i.e. transaction outputs not restricted by address.  
anyone-can-receive-empty = true # Anyone can receive empty output, i.e. without permission grants, asset transfers and zero native currency.  
anyone-can-create = false # Anyone can create new streams.  
anyone-can-issue = false # Anyone can issue new native assets.  
anyone-can-mine = false # Anyone can mine blocks (confirm transactions).  
anyone-can-activate = false # Anyone can grant or revoke connect, send and receive permissions.  
anyone-can-admin = false # Anyone can grant or revoke all permissions.  
support-miner-precheck = true # Require special metadata output with cached scriptPubKey for input, to support advanced miner checks
```

```
*****  
  
genesis-pubkey = 02ce30ca922a71bb3c3619fb4ebfcda5e6dd20eeb7f8d7e2e91bc9e33f2981ea2 # Genesis block coinbase output public key.  
genesis-version = 1 # Genesis block version.  
genesis-timestamp = 1507125110 # Genesis block timestamp.  
genesis-nbits = 536936447 # Genesis block difficulty (nBits).  
genesisnonce = 11 # Genesis block nonce.  
genesis-pubkey-hash = 01bb755bde7ac40f7bcf8aedf57cecc7a11b03bd # Genesis block coinbase output public key hash.  
genesishash = 00de3f3a14bc318509594f7885d95118a23ca3d2f15956ef139c4d2df83eb2c0 # Genesis block hash.  
chain-params-hash = 0767499eb07814d0ff423f210ba51fa19e3bdfa199f54c8cf049b4c35b52d542 # Hash of blockchain parameters, to prevent accidental changes.  
edureka@edureka:~
```

# Adding Connection Permission For The Address

- Add connection permissions for this address:

```
MultiChain-cli chain1 grant 13aNooyp2w...hpBYd connect
```

Above command will grant permission to connect to the specified address

```
edureka@edureka:~$ multichain-cli chain1 grant 13aNooyp2wXPW5NzuxvzGEDtEG6Hxtq8LhpBYd connect
{"method": "grant", "params": ["13aNooyp2wXPW5NzuxvzGEDtEG6Hxtq8LhpBYd", "connect"], "id": 1, "chain_name": "chain1"}

bf58290f89543b61f498e09d48d2b509ea1516e4f8183c1cbd61aeb267fd8b78
edureka@edureka:~$
```

Note: The address here is unique for this particular Blockchain. It will be different when you run your Blockchain

# Switching To Interactive Mode

- To enter the MultiChain interactive mode, on both servers run the following command:

```
MultiChain-cli chain1
```

Server 1 →

```
edureka@edureka:~$ multichain-cli chain1
MultiChain 1.0.1 RPC client
Interactive mode
chain1: |
```

Server 2 →

```
edureka@edureka:~$ multichain-cli chain1
MultiChain 1.0.1 RPC client
Interactive mode
chain1: |
```

Now that the Blockchain is working on two nodes, you can run the commands in this section on either or both
